

Single-electron MKAN row for Li: [4,16,6]

One electron feature row h_i is evaluated by the shared MKAN. Li calls this same row network for e_1 , e_2 , and e_3 .
pair real/imag channels into 3 complex orbitals

For Li, this same row computation is repeated for e_1 , e_2 , e_3 .

Rows are assembled into $\det(M_{\alpha}) * \det(M_{\beta})$.
