

Detailed Li MKAN Architecture: shared [4,16,6] applied to 3 electrons

Li: electrons=(2,1), complex_output=True, full_det=False. 6 real outputs = 3 complex orbital values.

Spin-block determinant assembly

M_{α} : rows e1,e2; columns psi1,psi2 $\rightarrow \det(M_{\alpha})$

M_{β} : row e3; column psi3 $\rightarrow \det(M_{\beta})$
